Intermediate O2

HMS Research Computing

We'll allow a few minutes for people to join the class.

Slides also at: github.com/hmsrc/user-training

IntermediateO2_Fall2020.pdf

Course Objectives

- Transferring data with rsync
- Linux tools
- Bash "for" loops
- Handling command output
- Customizing your O2 account environment
- SLURM deeper dive
- Cron
- Q&A

Housekeeping

- Please show your real first/last name in your Zoom profile so we can take attendance.
- This class is not being recorded.
 - Audio/Video for attendees is disabled by default.
- Zoom Chat anytime during class: for technical problems or general questions.
 - If it's not a quick answer, we should have time to discuss questions at the end of class.

Resources

- O2 docs:
 - https://wiki.rc.hms.harvard.edu/display/O2/
- Group Website
 - http://rc.hms.harvard.edu
 - *will be migrating to: https://it.hms.harvard.edu/rc
- Get Help:
 - rchelp@hms.harvard.edu
- HMS RC Office Hours: every Wed from 1-3pm via Zoom:
 - https://rc.hms.harvard.edu/office-hours

Stay informed about O2

O2 Status Page

- to view ongoing outages and scheduled maintenance
- https://wiki.rc.hms.harvard.edu/display/O2/O2+Cluster+Status

Twitter

https://twitter.com/hms_rc/

o2-announce email list

- Required for all O2 users
- Service outages, scheduled maintenance, other news

Message of the Day (MOTD)

That message in the terminal you see when you login to O2.

O₂ and the HMS VPN

You can login to O2 without using VPN

Duo (2FA) authentication required for each login

VPN can not support large file transfers

- Very limited bandwidth. Even 100 MB can be problematic
- Log out of VPN when copying data between your desktop and O2, or any HMS filesystem (e.g. research.files.med.harvard.edu)

Please only use VPN when you need to!

https://it.hms.harvard.edu/our-services/network-and-servers/vpn

HMS IT may kill any processes which are impacting VPN service.

Login to O2

If you don't have an O2 account, we can assign you a temporary one for the class.

O2 data transfer: which tool to use?

	Local	Remote	Not supported
Tools	cp rsync	sftp scp rsync wget ftp rclone [more]	Inbound FTP and generally anything which not sending over SSH (port 22).

rsync: most common use

- Local on O2:
 - \$ rsync -av source/ destination/

```
-a (-rlptgoD , recursive and preserves permissions)
-v (verbose)
```

- Over a network to O2:
 - \$ rsync -av -e ssh source/ user@transfer.rc.hms.harvard.edu:destination/

```
-z (data compression) may be useful for external transfers
```

Dry run (-n): test your command without actually copying data

```
$ rsync -n -av source/ destination/
```

Exercise: rsync

- Copy the class directory with rsync: (dry run: -n)
 - \$ rsync -n -av /n/groups/rc-training/o2_intermediate ~/
- For real:
 - \$ rsync -av /n/groups/rc-training/o2 intermediate ~/

Note that adding a trailing slash on the source directory will have rsync only copy the files within, not the directory itself.

rsync: more options

- Synchronize directories (be careful !!)
 - \$ rsync -delete -av source/ destination/
 - this overwrites and deletes files in the destination which don't match what is in the source.
- Set permissions

```
$ rsync -chmod=ug+rw [..]
```

Exclude patterns or a list of files from transfer:

```
$ rsync -exclude '*.bam' [..]
```

\$ rsync -exclude-from 'exclude-list.txt' [..]

Command line shortcuts

- autocomplete filename / command Tab
- Ctrl + c kill command you are currently running
- Ctrl + a move to the beginning of the line
- Ctrl + d logout
- Ctrl + e move to the end of the line
- Ctrl + k erase line to the right
- Ctrl + I clear the terminal
- erase line to the left Ctrl + u
- Ctrl + w erase word to the left
- [arrow keys] move cursor, browse command history

head / tail / less / more / cat

- Commands to view text in a file or stream.
- Exercise: examine contents of a data file

```
$ cd ~/o2 intermediate/data
$ cat example.gtf
$ head example.gtf
$ head -20 example.gtf
$ tail example.gtf
$ tail -20 example.gtf
$ tail -f example.gtf
                       (CTRL-C to quit)
$ more example.gtf ("q" or CTRL-C to quit, "return" or "space" to scroll)
$ less example.gtf
                       ("q" to quit, arrows and other keys for navigation)
```

ln

- A link is a special file type
 - In with the -s option is the most common use: "symbolic"
 - Symbolic links work across filesystems
- Example / Exercise:

```
$ mkdir work
```

\$ In -s work shortcut

\$ Is -I

(make a directory) (make a link called "shortcut") (lower-case "L" file type)

find

- find [path to search] [expression] [actions]
 - -name : the filename / pattern
 - -user : user owner
 - -group : group owner
 - -type : type of file (plain file, directory, pipe. etc)
 - -ctime: time of file creation
 - -atime: last access time of a file
 - -mtime: last modification time of a file
 - -exec [command]: runs a command against find's output

find: examples

- List all files matching the name *.bam
 - \$ find ./dir -name '*.bam'
- Make all files group-writable under a directory:
 - \$ find ./dir -type d -exec chmod -v g+rwxs {} \;
 - \$ find ./dir -type f -exec chmod -v g+rw {} \;
 - \$ find ./dir -exec chgrp -v labgroup {} \;
- Remove files not updated in the past 60 days:
 - \$ find ./dir -mtime +60d -exec rm -v {} \;

find: exercise

 Create symbolic links to all bam files located under a directory tree:

```
$ cd ~/o2 intermediate
$ find . -name '*.bam'
$ find . -name '*.bam' -exec ln -s {} \;
$ 1s -1
```

• Don't delete these links - we'll use them later!

WC

- word count
 - print number of lines
 - -w print number of words
- Example: (how many lines are in a file)
 - \$ cd ~/o2_intermediate/data
 - \$ wc -I example.gtf

du

- estimate file space usage
 - [default] print summary size only (Kb)
 - print usage of all files
 - print human readable format (Kb/Mb/Gb/Tb)
- Example: (how many lines are in a file)
 - \$ cd ~/o2_intermediate/data
 - \$ du -h example.gtf
 - **\$** du -a
 - \$ du -ah

Commands for Text Processing

sort

sort lines of text

```
$ sort file.txt
```

```
(reverse order)
```

(ignore case)

(human numeric sort: e.g. 2K, 1G, 500M)

(remove duplicate lines) -U

Exercise: sort

- \$ cd ~/o2_intermediate
- \$ cat sort.txt
- \$ sort sort.txt
- \$ sort -r sort.txt

uniq

report or omit repeated lines

```
$ uniq
        file.txt
```

- (ignore case)
- (prefix lines by number of occurrences)
- (print only repeated lines)
- (print only unique lines) • -u

Exercise: uniq

Try these commands:

```
$ cd ~/o2 intermediate
```

```
$ cat uniq.txt
```

\$ uniq uniq.txt

\$ uniq -d uniq.txt

\$ uniq -u uniq.txt

\$ uniq -c uniq.txt

(remove duplicate entries)

(show duplicates only)

(show unique entries only)

(unique entries with count)

grep (global regular expression print)

- print lines matching a pattern
 - \$ grep pattern file.txt
 - \$ grep '#pattern 2' file.txt
- a few common options:
 - -i (case-insensitive)
 - (does not match the pattern)
 - (precede matching line with a line number) -n

Exercise: grep

- \$ cd ~/o2 intermediate/data
- \$ grep stop codon example.gtf
- \$ grep -v stop codon example.gtf
- \$ grep -n stop codon example.gtf
- \$ grep -i cds example.gtf

cut

- remove sections from each line in a file / stream
 - -d defines delimiter (default is a Tab)
 - -s prints only lines containing a delimiter
 - -f prints specified fields

Examples:

```
$ cut -f 1 file.txt
                                    (print 1st field only)
$ cut -f 1,3 file.txt
                                    (print 1st & 3rd fields)
$ cut -s -d ":" -f 1 file.txt
                                    (colon space delimiter)
$ O2squeue | cut -s -d " " -f 1
                                    (list of O2 job IDs)
```

Exercise: cut

- remove sections from each line in a file / stream
- default delimiter is a Tab
 - \$ cd ~/o2 intermediate/data
 - \$ head example.tab
 - \$ cut -f 1,2 example.tab | head
 - \$ cut -f 3,4 example.tab | head

paste

- Write lines consisting of the sequentially corresponding lines from each FILE, separated by TABs, to standard output.
 - defines delimiter (default is a Tab)
- Examples:
 - \$ paste file1.txt file2.txt
 - \$ paste file1.txt file2.txt > out.tsv (tab separated file)
 - \$ paste -d , file1.txt file2.txt > out.csv (comma separated file)

Working with Command Output

Command output redirection:

- Redirect: >
 - sends output to a file, overwrites any existing file
 - \$ grep pattern file.txt > out.txt
- Append: >>
 - sends output to a file, appends to any existing file
 - \$ grep pattern file.txt >> out.txt
- Pipe:
 - sends output to be input for another application
 - \$ cut -1 file.txt | sort | uniq -c

Exercise: handling command output

- Sort field entries from a data file (example.gtf)
- default delimiter is a Tab

```
$ cd ~/o2_intermediate/data
```

- \$ cut -f 4 example.gtf > out.txt
- \$ grep -i cds example.gtf >> out.txt
- \$ cut -f 4 example.gtf > out.txt
- \$ cut -f 4 example.gtf | sort -n | uniq -c
- \$ grep stop codon example.gtf | wc -l

Redirecting Standard Error (stderr)

bash syntax:

```
$ command 2>out.err
                            (send stderr to a file)
```

\$ command 2>&1 (send stderr to stdout)

\$ command > out.txt 2>&1 (send stderr and stdout to a file)

Exercise:

```
$ cd ~/o2_intermediate
```

\$ cat no.txt

\$ cat no.txt 2>out.err

(file does not exist — error)

(saves stderr to a file: out.err)

Customizing your O2 account

Customizing your O2 account

- Aliases: create your own commands!
 - \$ alias h=history
- Change your default umask
 - Example: create group-writable files by default:
 - \$ umask 0002
- Set, environment variables like command path:
 - \$ export PATH=\$PATH:/home/user/bin

Adding customizations on login

- ~/.bash profile
 - executed on login
 - executed once before you get a prompt.

~/.bashrc

- Supplemental config file, executed each time you run "bash"
- On O2, gets run from ~/.bash_profile
- Typically, this is where most customizations go:
- aliases, modules, \$PATH, other variables, etc.

Sample ~/.bashrc file

```
$ cat ~/.bashrc
#
alias h history
#
module load gcc/6.2.0
module load R/3.5.1
#
export PATH=$PATH:/home/user/bin
export DUO PASSCODE=push
```

Exercise: edit your .bashrc file

\$ nano ~/.bashrc

(Add some things you would like to set automatically on login)

\$ source ~/.bashrc

(to manually run it without having to re-login)

Try it out! (Run an alias command, etc)

bash "for" loops

Automate commands with a "for" loop

- Repeat commands against an designated list
 - this syntax is for bash, but other shells (tcsh) are different

Examples

```
$ for i in 1 2 3; do mkdir $i; done
$ for i in `cat list`; do cp $i ~/work; done
```

- more complex loops can be put in bash scripts
- also useful for submitting batches of jobs to O2!

"for" loop in a shell script

```
#!/bin/bash
list=/home/user/files.txt
for i in `cat $list`
  do
     [command 1]
     [command 2]
  done
```

more about Slurm...

Job Monitoring

```
02squeue
$ squeue -u your_user
 squeue -u your user -t PENDING
 squeue -u your user -t RUNNING
 squeue -u your user -p short
$ scontrol show jobid <jobid>
  (for more details)
$ 02sacct
$ sacct -j <jobid>
```

Jobs with command line arguments

Run the following:

```
$ cd ~/o2 intermediate
$ sbatch arguments.sbatch hello
$ O2squeue (to view job status)
```

- The output file will contain the argument "hello"
- This technique gets more useful when submitting from a script and the arguments vary over iterations.

Jobs with command line arguments

```
#!/bin/bash
                   #partition
#SBATCH -p short
#SBATCH -t 0-01:00 #time days-hr:min
#SBATCH -o %j.out #out file
#SBATCH -e %j.err #error file
echo $1
```

A better example (bamsort.sbatch)

```
#!/bin/bash
#SBATCH -p short #partition
#SBATCH -t 0-01:00 #time days-hr:min
#SBATCH -o %j.out #out file
#SBATCH -e %j.err #error file
## Update path below and uncomment for your account:
## dir=/home/rc training000/o2 intermediate/data
module load gcc/6.2.0
module load samtools/1.9
samtools sort $1 > $dir/"${1%.*}".sorted.bam
#where $1 is a bam file
```

Using sbatch with a bash "for" loop

To submit a bunch of separate jobs systematically:

```
$ for i in [input]; do [sbatch command]; done
```

Exercise (remember those symbolic links?):

```
$ cd ~/o2_intermediate
$ for i in *.bam; do sbatch bamsort.sbatch $i; done
```

Canceling one or more job

The [-u] option is always required.

```
$ scancel -u your user
$ scancel -u your user -v[vv]
$ scancel -u your user -p short
$ scancel -u your user -t PENDING
$ scancel -u your user -t RUNNING
$ scancel -u your user -t SUSPENDED
$ scancel -u your user JOBID1 JOBID2 [..]
```

Cron

Process automation: cron

- Task Scheduler for Linux
- O2 has a centralized cron server where jobs get executed.
- Examples:
 - Automate a nightly rsync process
 - Run a weekly analysis report
 - Purge old files on a schedule

Cron: Editing a Crontab

- Create/Edit a crontab from a login server using: crontab -e
- Format of a cron job process:

```
[Minute] [Hour] [Date] [Month] [Day of the Week] Command
Asterisk (*) = "every"
```

Example: have a job run at 2:00am every Monday:

0 2 * * 1 sbatch /home/user/rsync.sbatch

Thank you!

 The Harvard Training Portal will be emailing you a short survey about the class. Please complete it so we can learn what works, what needs improvement, and what you'd like to see offered in the future!
